Attempt : 1 Total Mark : 30 Marks Obtained : 30

Section 1: Coding

1. Problem Statement

A company is creating email accounts for its new employees. They want to use a naming convention for email addresses that consists of the first letter of the employee's first name, followed by their last name, followed by @company.com.

The company also has a separate email domain for administrative employees.

Write a program that prompts the user for their first name, last name, role, and company and then generates their email address using the appropriate naming convention based on their role. This is demonstrated in the below examples.

Note:

The generated email address should consist of the first letter of the first name, the last name in lowercase, and a suffix based on the role and company, all in lowercase.

Input Format

The first line of input consists of the first name of an employee as a string.

The second line consists of the last name of an employee as a string.

The third line consists of the role of the employee as a string.

The last line consists of the company name as a string.

The output consists of a single line containing the generated email address for the employee, following the specified naming convention

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: John Smith admin iamNeo

Output: jsmith@admin.iamneo.com

Answer

```
# You are using Python
   first_name=input().strip().lower()
   last_name=input().strip().lower()
   role=input().strip().lower()
   company=input().strip().lower()
   email=first_name[0]+last_name
   if role=="admin":
      email+="@admin."+company+".com"
   else:
   email+="@"+company+".com"
print(email)
```

Status: Correct Marks: 10/10

2. Problem Statement

Gina is working on a data analysis task where she needs to extract sublists from a given list of integers and find the median of each sublist. For each median found, she also needs to determine its negative index in the original list.

Help Gina by writing a program that performs these tasks.

Note: The median is the middle value in the sorted list of numbers, or the first value of the two middle values if the list has an even number of elements.

Example

Input

10

123457891011

3

15

26

3 10

Output

3:-8

4:-7

7:-5

Explanation

For the first range (1 to 5), the sublist is [1, 2, 3, 4, 5]. The median is 3, and its negative index in the original list is -8.

For the second range (2 to 6), the sublist is [2, 3, 4, 5, 7]. The median is 4, and its negative index in the original list is -7.

For the third range (3 to 10), the sublist is [3, 4, 5, 7, 8, 9, 10, 11]. The median is 7, and its negative index in the original list is -5.

Input Format

The first line of input consists of an integer N, representing the number of elements in the list.

The second line consists of N space-separated integers representing the elements of the list.

The third line consists of an integer R, representing the number of ranges.

The next R lines each consist of two integers separated by space representing the start and end indices (1-based) of the ranges.

Output Format

The output consists of n lines, displaying "X: Y" where X is the median of the sublist and Y is the negative index in the original list.

Refer to the sample output for the formatting specifications.

Sample Test Case

```
Input: 10
1 2 3 4 5 7 8 9 10 11
3
1 5
2 6
3 10
Output: 3 : -8
4 : -7
7 : -5

Answer
```

You are using Python

n=int(input())

2,070762,

04010162,

```
arr=list(map(int,input().split()))
for _ in range(int(input())):
    l,r=map(int,input().split())
    sub=sorted(arr[l-1:r])
    median=sub[(len(sub)-1)//2]
    print(f"{median}:{arr.index(median)-n}")
```

Status: Correct Marks: 10/10

3. Problem Statement

You have two strings str1 and str2, both of equal length.

Write a Python program to concatenate the two strings such that the first character of str1 is followed by the first character of str2, the second character of str1 is followed by the second character of str2, and so on.

For example, if str1 is "abc" and str2 is "def", the output should be "adbecf".

Input Format

The input consists of two strings in each line.

Output Format

The output displays the concatenated string in the mentioned format.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: abc

def

Output: adbecf

Answer

You are using Python str1=input() str2=input()

04010162,

result=".join(a+b for a,b in zip(str1,str2)) 240701 print(result)

Status: Correct
